

VENKATESAN “VENKY” RAMANATHAN

Technology Leader

Austin, TX | (570) 817-1128 | venkydec.20@gmail.com | linkedin.com/in/venky0411 | github.com/venkybobby

PROFESSIONAL SUMMARY

Senior engineering leader with 22+ years building the pharmacy, PBM and payer platforms that health care's connected-experience ambitions depend on. Spent a career on the transformation, Patient and Prescriber experience: a patient, a caregiver or a prescriber should get one consistent, trustworthy picture of their care regardless of which front door they walk through.

Architected and delivered a single canonical prescription-status layer spanning home delivery pharmacy, specialty pharmacy and PBM — deliberately built as micro frontends so one view could be embedded across call center, patient portals and provider-facing surfaces. Call center agents get the operational depth they need to resolve a call; patients entering through a PBM, specialty pharmacy or payer portal get the same underlying truth at the right altitude, including when a prescription is held awaiting prior authorization. One source of truth, many audiences, no duplicated logic.

That canonical layer is what makes agentic AI viable in health care rather than a guess across silos. Recent hands-on work includes building and deploying agent-based systems on Google Cloud Vertex AI, including model routing across tiers and evaluation of agent decisions.

Led organizations of 180+ engineers across onshore, offshore and vendor teams, with portfolio ownership above \$20M annually.

INTEGRATION & INTEROPERABILITY ACROSS THE HEALTH ECOSYSTEM

Health Plans & Payers: Technology strategy for Blues; Cigna payer-owned specialty platforms serving 1M+ patients

PBM & Pharmacy: Medco and Express Scripts home delivery; Accredo specialty pharmacy — Common Intake, Prescription Processor, Claim Engine; 100K+ prescriptions/day; 340B

Prescribers & Providers: Surescripts e-prescribe, fax, and verbal referral intake; prior-authorization platform at 500K+ transactions/month

Consumers & Patients: One canonical order-status view shared by patients, call center, and prescribers across 2M+ annual interactions; eligibility, benefits verification, and copay assistance

Integration Patterns: Event-driven integration (EventBridge, Kafka, MQ), CQRS read models, REST/API-first microservices, versioned rollouts against external dependencies

PROFESSIONAL EXPERIENCE

Accenture — Technology Strategy Lead, Healthcare

Mar 2026 – Present

Technology leader for strategy across healthcare clients — Centene and HCSC

- Drive enterprise AI and technology strategy for two \$1B+ health plans, translating complex payer data ecosystems into phased, multi-year capability roadmaps.
- Launched AI Autonomous SDLC operating model — intake, prioritization, design review, release readiness — aligning C-suite and technology stakeholders.

Cigna — Accredo Specialty Pharmacy | Director, Software Engineering

2022 – Jan 2026

- Architected a single canonical prescription-status layer (CQRS on EventBridge with a MongoDB read model) and delivered it as reusable micro frontends embedded across the call center, the PBM, Accredo, and Cigna member portals, and prescriber-facing surfaces — every audience seeing the same source of truth at its own depth, from agent-level operational detail to patient-level status including prior-authorization holds.
- Closed a 17-year order-visibility gap across 2M+ annual patient interactions, cutting order-status calls from 10–15 to 2–3 minutes against a 6–7 minute projection.
- Owned the Accredo call-center product and its multi-year modernization roadmap, re-platforming from Pega to React micro frontends and AWS Lambda/Step Functions and migrating 1,100+ specialty drugs therapy by therapy — reducing Average Handle Time 100+ seconds per call (~\$4M+ annual savings).
- Led a \$20M+ annual portfolio through managers and 180+ onshore/offshore engineers and vendor partners — owning hiring, performance management, budgets, and vendor workforce strategy.
- Architected the organization's first agentic AI workflow for clinical assessments and Adverse Event reporting, compressing cycle time from days to hours with zero escalation failures through embedded safety controls, auditability, and escalation logic.
- Established delivery governance for a live 1,000+ agent operation: two-tier frontend/backend versioning and a pilot rollout model (15 pilot agents for 1–5 days, then full rollout) that de-risked every release.
- Rebuilt Order Scheduling on Lambda, Step Functions, and DynamoDB with pre-populated orders and calculated medication-on-hand, cutting scheduling calls from 9–10 to 3–4 minutes against a 5–6 minute projection.

- Raised engineering productivity ~30% across 180+ engineers with GitHub Copilot and AI-assisted development standards, tracked through engineering productivity and delivery KPIs.

Cigna — Accredo Specialty Pharmacy | Senior Manager, Software Engineering

2020 – 2022

- Reduced Sev-1/Sev-2 incidents 40%+ on Tier-1 specialty CRM platforms serving 1M+ patients, and grew 15+ tech leads and managers into an internal promotion pipeline.

CVS Health — NovoLogix | Senior Manager, Application Development

2018 – 2020

- Launched 7 production microservices with zero post-release defects on a prior-authorization platform processing 500K+ transactions/month, leading 30+ engineers; cut release cycle time 35% by modernizing .NET/WCF to Angular + REST on Azure with GitLab/Jenkins CI/CD.

Cognizant — Medco • Express Scripts • Accredo Specialty Pharmacy | Engagement & Delivery Lead

2011 – 2018

- Won the Common Intake RFP and led delivery of Accredo's RXHOME decomposition — breaking an Oracle Forms/stored-procedure monolith confined to a single monthly Friday-night release window into independently releasable products; delivered Common Intake, Prescription Processor, and part of the Claim Engine.
- Unified Surescripts e-prescribe, fax, and verbal referrals into Common Intake to attack intake delays driving 30–40% referral loss; chose deterministic rules automation where legacy Oracle data could not support reliable ML.
- Drove a \$40M/year specialty transformation program and won three consecutive proposals worth \$12M; delivered automation (Sig Translator, eRx data entry, eligibility identification) worth \$24M+/year; cut regression cycle time 50% with CI/CD and BDD automation.
- Began on Medco home delivery prescription processing and carried platforms through the 2012 Medco–Express Scripts merger and 2013 Accredo integration; delivered 340B program work.

Cognizant — Ford • SallieMae • Southern California Edison | Technical Lead

2003 – 2011

- Technical lead for business-critical global ordering systems at Ford and enterprise platforms in financial services and utilities.

SKILLS

Engineering & Cloud: Microservices & API-first design, Python (FastAPI), Java/J2EE, React micro frontends, CQRS & event-driven architecture (EventBridge, Kafka, MQ), AWS (Lambda, Step Functions, DynamoDB, Bedrock), Google Cloud (Vertex AI, Artifact Registry), Azure, Docker, MongoDB, Oracle, CI/CD

AI & Leadership: Agentic AI & LLM integration (Claude, Bedrock, Vertex AI), agent evaluation, Claude Code, GitHub Copilot; modernization roadmaps, value stream optimization, KPIs, SAFe/Agile, distributed teams, vendor management | PMP | SAFe Agilist

OPEN-SOURCE AI ENGINEERING — github.com/venkybobby

- Healthcare Claims AI Agents: built and deployed a containerized (Docker) claims-anomaly agent to Google Cloud Vertex AI — X12 837P parsing, NCCI edits, OIG exclusion screening, and medical-necessity checks via versioned YAML rule packs with pytest safety and end-to-end suites; extending to appeals & grievances.
- SARO: built a Python (FastAPI) + React platform evaluating AWS Bedrock invocation logs against versioned rule packs with zero-PHI retention.

EDUCATION

MBA, Healthcare Management — University of Hartford | B.E., Electronics & Communication Engineering — REC Tiruchirappalli, India
